

std::exception

```
classDiagram
    class std_exception["std::exception"]
    class RayTracer_Main_MainError["RayTracer::Main::MainError"]
    RayTracer_Main_MainError --|> std_exception
```

The diagram illustrates an inheritance relationship. At the top is a class box for 'std::exception' with three empty compartments. Below it is a class box for 'RayTracer::Main::MainError' with three compartments: the top for the class name, the middle for a private attribute '- _message', and the bottom for public methods '+ MainError()' and '+ what()'. A blue arrow with an open triangle head points from the 'RayTracer::Main::MainError' box up to the 'std::exception' box, indicating that 'RayTracer::Main::MainError' inherits from 'std::exception'.

RayTracer::Main::MainError

- _message

+ MainError()

+ what()
