

std::exception

```
classDiagram
    class std_exception["std::exception"]
    class RayTracer_Display_display_module_StartFailed["RayTracer::Display::!DisplayModule::StartFailed"]
    RayTracer_Display_display_module_StartFailed --|> std_exception
```

The diagram illustrates an inheritance relationship. At the top is a class box for 'std::exception', which is divided into three horizontal sections: the top section contains the class name, and the two bottom sections are empty. Below it is a class box for 'RayTracer::Display::!DisplayModule::StartFailed', which is divided into three horizontal sections. The top section contains the class name, the middle section contains a private attribute '- \_error', and the bottom section contains two public methods '+ StartFailed()' and '+ what()'. A blue arrow with an open triangular head points from the top of the 'RayTracer::Display::!DisplayModule::StartFailed' box to the bottom of the 'std::exception' box, indicating that 'RayTracer::Display::!DisplayModule::StartFailed' inherits from 'std::exception'.

RayTracer::Display  
::!DisplayModule::StartFailed

- \_error

+ StartFailed()  
+ what()
